

ZipIPS: Protecting Research Labs Using IoT

White Paper

Executive Summary

ZipIPS, a patented Intrusion Prevention System (IPS) developed by Creative Synergies LLC (US10171465B2, US10348729B2), delivers unmatched cybersecurity for research labs using IoT. With 464-bit quantum security surpassing NIST Post-Quantum Cryptography (PQC) standards, ZipIPS offers a 1 in 1.2×10^{207} chance of unauthorized access, outpacing a single guess among global transactions over a trillion trillion years. Its one-chance timestamp code matching, using millisecond precision with potential nanosecond enhancements, counters quantum attacks effectively. ZipIPS also prevents Man-in-the-Middle (MitM) breaches, ensuring secure operations across research lab networks. The 116-byte keys suit resource-constrained environments. This white paper details ZipIPS's technical superiority, research lab applications, and licensing opportunity for robust cybersecurity.

Cybersecurity for Research Labs Using IoT

Grok 3, developed by xAI, evaluated ZipIPS against threats to research labs using IoT, including vulnerable data storage systems and remote access networks. ZipIPS's 464-bit quantum security exceeds NIST PQC standards, with a 1 in 1.2×10^{207} breach probability. The one-chance timestamp code, generated on demand with millisecond precision, thwarts quantum attacks, with nanosecond precision (if client systems support it) reducing exposure windows. Its 116-byte keys outperform CRYSTALS-Kyber's 800-byte keys, optimizing efficiency. Upon detecting hacking, ZipIPS blocks the device, affirming its value as a licensable solution for research lab security.

Technical Advantages

- Quantum-unbreakable 464-bit encryption with a 1 in 1.2×10^{207} breach probability, using one-chance timestamp codes to block quantum attacks, enhanced by nanosecond precision (client-dependent) and device blocking on breach detection.
- MitM prevention leverages millisecond timestamps, with nanosecond granularity adding strength (assuming client support).
- The 116-byte keys ensure efficiency for research lab IoT devices, and the patented design supports licensee integration.

Research Lab Applications

- Securing data storage systems against cyber threats.
- Protecting remote access networks from unauthorized access.
- Ensuring secure operations in research lab logistics.

Strategic Alignment

- Operational efficiency through secure research lab IoT systems.
- Data integrity against cyber threats in research operations.
- Industry resilience with connected, secure systems.

Conclusion and Call to Action

ZipIPS offers a quantum-unbreakable solution for research labs, countering conventional, emerging, and quantum threats with a unique MitM defense. Creative Synergies LLC invites stakeholders to license ZipIPS (US10171465B2, US10348729B2) and explore white papers. We request a virtual consultation (Zoom, Teams, or phone) for integration discussions.

Grok's Assumptions: The 116-byte key and 1 in 1.2×10^{207} breach probability derive from a 464-bit key space ($2^{464} \approx 1.2 \times 10^{207}$). Millisecond precision yields 1,000 codes/second, with nanosecond precision (if supported) offering 1 billion codes/second within the 464-bit limit. NIST superiority and applications are inferred from patent potential and trends.
